

Heat Pump Forum 2019

25 maart 2019

The HP Forum is a conference to put heat pump technology at the centre of the debate on the energy transition. 100% renewable heating is possible with today's technology.

At the Forum you will learn about the technologies recognition in policy – both on the European and Member State level. You will be informed about market development, and you will receive the first-hand experience from users of heat pump solutions in industry and the renovation sector.

This year's conference will bring together 200 business actors engaged in the energy transition, representatives from EU institutions, national and local governments, major players from the heating and cooling industry, energy companies and energy researcher to discuss about the following topics:

How did the Clean Energy4 all Package develop and what is the expected impact for the years to come?

Debate between Science and Policy: are we doing enough to close gaps between available and needed technologies

We need heat – can large heat pumps really help us?

New approaches for large HP deployment in cities and regions

Sector coupling in individual buildings: zero emission and plus energy houses as a reality of today

New business models based on flexibility as a service

The renovation challenge: decarbonisation of cities with heat pumps?

It would be our pleasure to welcome you to our conference. For more information you may contact Eirini Litina at Eirini.litina@ehpa.org

In case you would like to enhance your company's visibility during our conference, you can opt for a sponsorship package. More details [here](#).
